April 29, 2024

1 Einleitung

Dieser Report beschreibt das Data Exploration Projekt, das im Rahmen der Vorlesung durchgeführt wurde. Ziel ist es, durch explorative Datenanalyse und den Einsatz von Machine Learning-Methoden Erkenntnisse aus dem vorgegebenen Datensatz zu gewinnen. Der Code und die Ergebnisse sind in einem GitHub-Repository dokumentiert (https://github.com/laurenziu10/dep) und werden in diesem Jupyter Notebook präsentiert.

: DeprecationWarning:

Pyarrow will become a required dependency of pandas in the next major release of pandas (pandas 3.0),

(to allow more performant data types, such as the Arrow string type, and better interoperability with other libraries)

but was not found to be installed on your system.

If this would cause problems for you,

please provide us feedback at https://github.com/pandas-dev/pandas/issues/54466

import pandas as pd

2 Datencharakterisierung

2.1 Das Datenset

Der verwendete Datensatz, abrufbar unter dem Kaggle-Link (https://www.kaggle.com/datasets/uom190346a/disease-symptoms-and-patient-profile-dataset), umfasst Informationen zu Krankheitssymptomen und Patientenprofilen. Dieser Datensatz enthält eine breite Palette von Merkmalen, die sowohl klinische Symptome als auch demografische Daten von Patienten umfassen.

Beschreibung der Spalten:

Disease: Der Name der diagnostizierten Krankheit oder des medizinischen Zustands.

Fever: Gibt an, ob der Patient Fieber hat (Yes/No).

Cough: Gibt an, ob der Patient Husten hat (Yes/No).

Fatigue: Gibt an, ob der Patient Müdigkeit erfährt (Yes/No).

Difficulty Breathing: Gibt an, ob der Patient Atemschwierigkeiten hat (Yes/No).

Age: Das Alter des Patienten in Jahren.

Gender: Das Geschlecht des Patienten (Male/Female).

Blood Pressur: Der Blutdruck des Patienten, angegeben als Low, Normal oder High.

Cholesterol Level: Der Cholesterinspiegel des Patienten, angegeben als Low, Normal oder High.

Outcome Variable: Die Ergebnisvariable, die das Resultat der Diagnose oder Bewertung für die spezifische Krankheit anzeigt (Positive/Negative).

```
[]: # Import dataset
df = pd.read_csv('data/Disease_symptom_and_patient_profile_dataset.csv')
df
```

| []: | Disease | Fever | Cough | Fatigue | Difficulty | Breathing | Age | Gender | \ |
|-----|-------------|-------|-------|---------|------------|-----------|-----|--------|---|
| 0 | Influenza | Yes | No | Yes | | Yes | 19 | Female | |
| 1 | Common Cold | No | Yes | Yes | | No | 25 | Female | |
| 2 | Eczema | No | Yes | Yes | | No | 25 | Female | |
| 3 | Asthma | Yes | Yes | No | | Yes | 25 | Male | |
| 4 | Asthma | Yes | Yes | No | | Yes | 25 | Male | |
| | ••• | | ••• | | ••• | | | | |
| 344 | Stroke | Yes | No | Yes | | No | 80 | Female | |
| 345 | Stroke | Yes | No | Yes | | No | 85 | Male | |
| 346 | Stroke | Yes | No | Yes | | No | 85 | Male | |
| 347 | Stroke | Yes | No | Yes | | No | 90 | Female | |
| 348 | Stroke | Yes | No | Yes | | No | 90 | Female | |

| | Blood Pressure | Cholesterol Level | Outcome Variable |
|---|----------------|-------------------|------------------|
| 0 | Low | Normal | Positive |

| 347 | High | High | Positive |
| 348 | High | High | Positive |

[349 rows x 10 columns]

```
[]: # Overview of the dataset
print("Data overview:")
print(df.info())
```

Data overview:

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 349 entries, 0 to 348
Data columns (total 10 columns):

| # | Column | Non-Null Count | Dtype |
|---|----------------------|----------------|--------|
| | | | |
| 0 | Disease | 349 non-null | object |
| 1 | Fever | 349 non-null | object |
| 2 | Cough | 349 non-null | object |
| 3 | Fatigue | 349 non-null | object |
| 4 | Difficulty Breathing | 349 non-null | object |
| 5 | Age | 349 non-null | int64 |
| 6 | Gender | 349 non-null | object |
| 7 | Blood Pressure | 349 non-null | object |
| 8 | Cholesterol Level | 349 non-null | object |
| 9 | Outcome Variable | 349 non-null | object |

dtypes: int64(1), object(9)
memory usage: 27.4+ KB

None

Wie man sehen kann, sind alle Spalten, außer die Spalte 'Age' (int64), vom Typ object, also Strings.

```
[]: # Missing values
print("\nMissing values per column:")
print(df.isnull().sum())
```

Missing values per column:
Disease 0
Fever 0
Cough 0
Fatigue 0
Difficulty Breathing 0
Age 0

```
Gender 0
Blood Pressure 0
Cholesterol Level 0
Outcome Variable 0
```

dtype: int64

Es gibt somit keine fehlenden Werte in einer Spalte.

```
[]: # Statistical summary
print("\nStatistical summary:")
print(df.describe())
```

Statistical summary:

Age 349.000000 count 46.323782 mean std 13.085090 19.000000 min 25% 35.000000 50% 45.000000 75% 55.000000 max90.000000

Das Mindestalter der Patienten ist 19 und das Höchstalter ist 90.

```
[]: # Amount of unique values of each column df.nunique()
```

```
[]: Disease
                              116

Es werden nur die Krankheiten betrachtet, die mindestens 5 mal vorkommen. Am häufigsten kommen die Krankheiten Asthma, Osteoporosis, Hypertension, Migraine und Diabetes vor.

```
[]: correlation_matrix = df_cleaned.corr(numeric_only=True)

plt.figure(figsize=(8, 6))
sns.heatmap(correlation_matrix, annot=True, cmap='coolwarm')
plt.title('Korrelationsmatrix der Merkmale')
plt.show()
```

Fieber und Outcome Variable: Der Koeffizient von 0.343 zeigt eine moderate positive Korrelation. Das bedeutet, dass ein Anstieg der Fieberfälle tendenziell mit einem positiven Ausgang der Diagnose (Outcome Variable) zusammenhängt.

Müdigkeit und Outcome Variable: Mit einem Koeffizienten von 0.330 gibt es auch hier eine moderate positive Korrelation.

BP_High und Outcome Variable: Die Korrelation von 0.347 deutet darauf hin, dass höherer Blutdruck oft mit einem positiven Diagnoseergebnis korreliert ist.

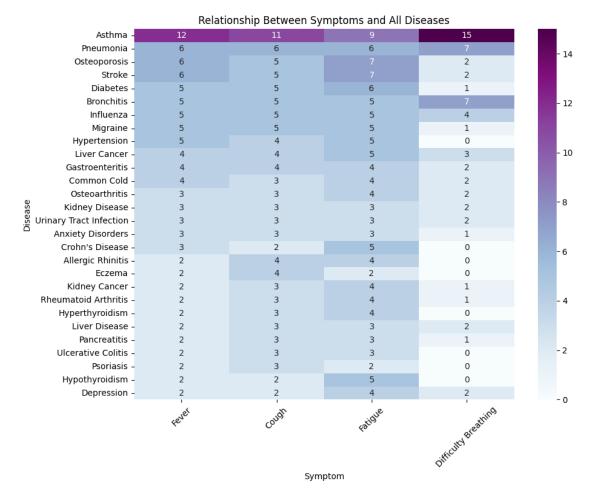

Merkmale wie Geschlecht und Alter zeigen geringere Korrelationen mit anderen Merkmalen, was darauf hindeutet, dass sie weniger direkte Vorhersagekraft für die betrachteten medizinischen Zustände haben könnten.

```
[]: symptom_columns = ['Fever', 'Cough', 'Fatigue', 'Difficulty Breathing']

# Analyze the relationship between symptoms and all diseases
symptoms_per_disease = df_cleaned.groupby('Disease')[symptom_columns].sum()
```

```

plt.ylabel('Disease')
plt.xlabel('Symptom')
plt.xticks(rotation=45) # Adjust rotation if necessary based on your data
plt.yticks(rotation=0) # Ensure y-ticks are not rotated
plt.tight_layout()
plt.show()
```

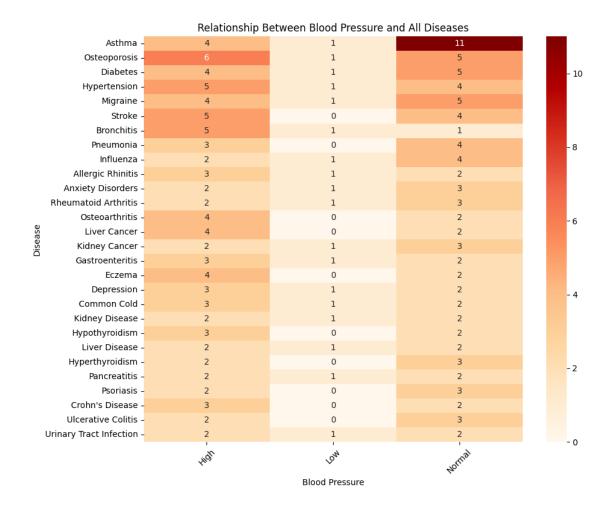

Asthma: Zum Beispiel zeigte die höchste Anzahl von Patienten mit Asthma Symptome von Atembeschwerden (15 Fälle), gefolgt von Fieber (12 Fälle). Dies spiegelt typische Symptome wider, die mit Asthma verbunden sind, wie Atemprobleme und eventuell begleitendes Fieber.

Pneumonia (Lungenentzündung) und Bronchitis: Beide Krankheiten zeigen ein ähnliches Profil mit einer moderaten Anzahl von Fieber-, Husten- und Atembeschwerdefällen, was auf die Beteiligung der Atemwege hinweist.

Diabetes und Schlaganfall (Stroke): Bei diesen Erkrankungen sind die Symptome weniger mit den Atemwegen und mehr mit allgemeiner Müdigkeit verbunden.

```
[]: # Analysis of the relationship between blood pressure and all diseases
     blood pressure disease relation = df cleaned.groupby('Disease')['Blood, |
      →Pressure'].value counts().unstack(fill value=0)
     # Sort diseases by the sum of their counts across blood pressure categories

     plt.tight_layout()
     plt.show()
```

Asthma: Beispielsweise haben die meisten Asthma-Patienten normale Blutdruckwerte (11 von 16), was darauf hindeutet, dass Asthma weniger Einfluss auf den Blutdruck zu haben scheint.

Osteoporose: Interessanterweise haben Patienten mit Osteoporose häufiger hohen Blutdruck (6 von 12), was auf eine mögliche Verbindung zwischen Osteoporose und kardiovaskulären Risikofaktoren hinweisen könnte.

Diabetes und Hypertonie: Beide Zustände sind bekannt für ihre Beziehung zu abnormalen Blutdruckwerten, was sich auch in dieser Tabelle zeigt, wo ein bedeutender Anteil der Patienten hohen Blutdruck aufweist.

| | | | Cholesterol Level | | | |

Diabetes: Auffällig ist der hohe Anteil von Patienten mit hohem Cholesterin (7 von 10). Diabetes ist bekannt dafür, dass er oft mit hohen Cholesterinwerten einhergeht, was das Risiko für kardiovaskuläre Erkrankungen erhöht.

Hypothyroidism (Unterfunktion der Schilddrüse): Alle Patienten mit dieser Krankheit haben hohe Cholesterinwerte, was eine direkte Auswirkung der Krankheit auf den Fettstoffwechsel zeigt.

Krankheiten wie Allergic Rhinitis und Psoriasis: Diese zeigen eine gleichmäßigere Verteilung zwischen den Cholesterinspiegel-Kategorien, was darauf hindeutet, dass diese Krankheiten weniger Einfluss auf den Cholesterinspiegel haben könnten.

[193 rows x 13 columns]

Der "Symptom Score" gibt die Gesamtzahl der Symptome an, die ein Patient hat, und bietet eine einfache, quantifizierbare Metrik zur Bewertung der Krankheitsschwere oder -aktivität. Ein höherer Symptom Score könnte auf eine schwerere oder aktivere Krankheit hindeuten und kann als prädiktiver Faktor in Modellen verwendet werden. Anschließend teilt der Code den Datensatz in Trainings- und Testsets auf, wobei er einen bestimmten Prozentsatz der Daten für die unabhängige Überprüfung der Modelleistung reserviert (20%). Diese Aufteilung ist entscheidend für das Trainieren von robusten, generalisierbaren Modellen und ermöglicht es, die Vorhersagefähigkeit des Modells auf bisher unbekannten Daten zu evaluieren.

```
[]: # Initialize models
model_rf = RandomForestClassifier(n_estimators=100, random_state=42)
model_rf.fit(X_train, y_train)

# Evaluations
accuracy_rf = accuracy_score(y_test, model_rf.predict(X_test))
print(f'Accuracy of Random Forest: {accuracy_rf * 100:.2f}%')
```

Accuracy of Random Forest: 76.92%

Der Codeabschnitt beschreibt den Prozess der Modellinitialisierung, des Trainings und der Bewertung für ein maschinelles Lernmodell, in diesem Fall ein Random Forest Klassifikator. Der Abschnitt demonstriert, wie ein Modell vorbereitet, auf Basis von Trainingsdaten trainiert und dann mit einem Testdatensatz evaluiert wird. Die berechnete Genauigkeit (76.92%, kann nach jedem Durchlauf des Codes abweichen) gibt an, wie gut das Modell die Datenklassifikation im Vergleich zu den tatsächlichen Labels ausführt. Diese Vorgehensweise ist ein fundamentaler Bestandteil des maschinellen Lernens, der hilft, die Leistungsfähigkeit eines Modells zu verstehen und zu beurteilen.

Der Random Forest Algorithmus ist für dieses Beispiel besonders nützlich, da er robuste Leistungsfähigkeit und Genauigkeit bei der Klassifikation in komplexen Datensätzen bietet. Random Forest, ein Ensemble-Lernverfahren, das auf mehreren Entscheidungsbäumen basiert und ihre Vorhersagen aggregiert, ist effektiv in der Handhabung von großen Datenmengen mit vielen Variablen, wie es oft in medizinischen Datensätzen der Fall ist.

Einer der Hauptvorteile von Random Forest ist seine Fähigkeit, Overfitting zu vermeiden, das bei einzelnen Entscheidungsbäumen häufig auftritt. Dies wird durch die Kombination der Vorhersagen aus vielen Bäumen erreicht, die jeweils auf zufälligen Teilmengen der Trainingsdaten trainiert wurden. Dies erhöht die Generalisierbarkeit des Modells auf neue, unbekannte Daten, was für medizinische Anwendungen kritisch ist, wo die Genauigkeit der Vorhersage potenziell lebensrettende Auswirkungen haben kann.

```
[]: def evaluate_model(model, X_test, y_test):
         # Model predictions
         y_pred = model.predict(X_test)
         y probs = model.predict proba(X test)[:, 1] # Wahrscheinlichkeiten für die
      ⇔positive Klasse
         # Calculate metrics
         accuracy = accuracy_score(y_test, y_pred)
         precision = precision_score(y_test, y_pred)
         recall = recall_score(y_test, y_pred)

```

Metrics for RandomForest:

Accuracy: 76.92% Precision: 66.67% Recall: 71.43% F1-Score: 68.97% ROC-AUC: 80.00%

Die Genauigkeit misst den Prozentsatz der Gesamtvorhersagen, die korrekt waren, und gibt damit an, wie oft das Modell insgesamt richtig liegt. Die Präzision bewertet, wie viele der als positiv klassifizierten Fälle tatsächlich positiv sind, was wichtig ist, um die Zuverlässigkeit der positiven Vorhersagen des Modells zu verstehen. Der Recall zeigt, wie viele der tatsächlich positiven Fälle vom Modell erkannt wurden, was in medizinischen oder anderen kritischen Anwendungen essentiell sein kann, um sicherzustellen, dass wenige bis keine positiven Fälle übersehen werden. Der F1-Score, der harmonische Mittelwert von Präzision und Recall, bietet eine einzige Metrik, die beide Aspekte der Leistung in sich vereint, was besonders nützlich ist, wenn ein Ausgleich zwischen Präzision und Recall erreicht werden soll.

Das Merkmal "Age" steht mit einer Wichtigkeit von etwa 28.54% an der Spitze, was darauf hindeutet, dass das Alter des Patienten ein entscheidender Faktor bei der Vorhersage des Gesundheitszustands ist. Eng verbunden damit ist der "Symptom Score", der eine aggregierte Bewertung der Symptome eines Patienten darstellt und eine Wichtigkeit von ungefähr 11.09% aufweist. Weitere wichtige Merkmale sind "Fever", "Fatigue", "BP_high" und "Cholesterol_High", was die Bedeutung dieser klinischen Indikatoren unterstreicht.

Interessanterweise zeigt die Tabelle auch, dass das Geschlecht des Patienten mit einer Wichtigkeit von etwa 6.85% ebenfalls eine Rolle spielt. Andere Merkmale wie "Cough", "BP_Normal" und "Difficulty Breathing" sind ebenfalls von Bedeutung, allerdings in geringerem Ausmaß.

```
[]: # Output the best hyperparameters
print("Best hyperparameters:", grid_search.best_params_)
```

```
Best hyperparameters: {'max_depth': 10, 'max_features': 'sqrt',
'min_samples_leaf': 1, 'min_samples_split': 2, 'n_estimators': 400}
```

Die besten Hyperparameter für das Random Forest Modell wurden durch GridSearch identifiziert, der die maximale Baumtiefe (max_depth) auf 10 setzte, die Anzahl der Features, die bei jedem Split berücksichtigt werden (max_features), auf die Wurzel der Featureanzahl begrenzte, ein Blattknoten mindestens ein Sample haben muss (min_samples_leaf), mindestens zwei Samples erforderlich sind, um einen internen Knoten zu teilen (min_samples_split), und die Anzahl der Bäume im Wald (n_estimators) auf 400 erhöht wurde. Diese Konfiguration führte zu einer besten erreichten ROC-AUC (Receiver Operating Characteristic - Area Under Curve) von 85,93%, was die Fähigkeit des Modells zeigt, zwischen den Klassen effektiv zu unterscheiden und eine hohe Vorhersagegenauigkeit zu gewährleisten.

Die Leistung des Modells bei der Klassifikation wird durch verschiedene Metriken detailliert dargestellt. Für die Klasse 0 ("negatives Ergebnis") erreicht das Modell eine Präzision, einen Recall und einen F1-Score von jeweils 84%, was eine hohe Übereinstimmung zwischen Vorhersage und tatsächlichem Ergebnis anzeigt. Für die Klasse 1 ("positives Ergebnis") sind die Werte jeweils 71%, was auf eine etwas geringere, aber immer noch robuste Vorhersagegenauigkeit hinweist. Insgesamt erreicht das Modell eine Gesamtgenauigkeit von 79% über beide Klassen. Diese Metriken verdeutlichen, dass das Modell insgesamt eine ausgewogene Leistung zwischen den beiden Klassen zeigt, mit einer etwas stärkeren Vorhersagefähigkeit für die Klasse 0.

```
[]: # Initialize the RandomForest model with the best hyperparameters
    optimized_rf = RandomForestClassifier(
        max_depth=10,
        max_features="sqrt",
        min_samples_leaf=1,
        min_samples_split=2,
        n_estimators=400,
```

```

```

Optimized RandomForest Model

Accuracy: 79.49% Precision: 71.43% Recall: 71.43% F1-Score: 71.43% ROC-AUC: 81.43%

Das optimierte Random Forest Modell zeigt eine Genauigkeit von 79,49%, eine Präzision von 71,43%, einen Recall von ebenfalls 71,43% und einen F1-Score von 71,43%. Diese Ergebnisse stellen eine Verbesserung gegenüber dem ursprünglichen Modell dar, welches eine Genauigkeit von 76,92%, eine Präzision von 66,67%, einen Recall von 71,43% und einen F1-Score von 68,97% erreichte. Die Steigerung der Genauigkeit und Präzision deutet darauf hin, dass das optimierte Modell in der Lage ist, die positiven Fälle genauer zu identifizieren und dabei weniger Fehler zu machen. Die Konstanz beim Recall bedeutet, dass das Modell weiterhin einen hohen Anteil der tatsächlichen positiven Fälle korrekt identifiziert. Diese Verbesserungen könnten durch die Anpassung der Hyperparameter wie maximale Tiefe der Bäume, Anzahl der Features für das Splitting und die Anzahl der Bäume im Modell erreicht worden sein.

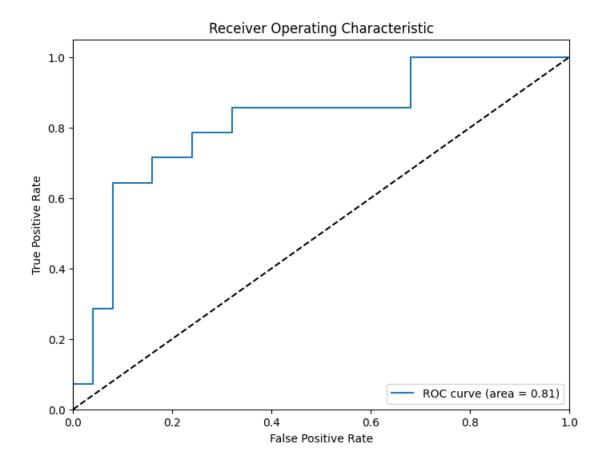

```

Die Konfusionsmatrix zeigt die Leistung des Modells bei der Klassifikation von Testdaten nach der Anpassung des Schwellenwerts. Aus der Matrix ist ersichtlich, dass das Modell 23 wahre Negative (keine Erkrankung korrekt identifiziert) und 9 wahre Positive (korrekt identifizierte Erkrankungen) korrekt vorhergesagt hat. Es gab jedoch auch 2 falsch positive Fälle (fälschlicherweise als Erkrankung klassifiziert) und 5 falsch negative Fälle (Erkrankung nicht erkannt). Diese Zahlen spiegeln die zuvor diskutierten Präzisions- und Recall-Werte wider und verdeutlichen, wie der angepasste Schwellenwert zur Reduktion von Fehlern beiträgt, insbesondere zur Minimierung von falsch positiven Ergebnissen, was in vielen klinischen Szenarien als kritisch angesehen wird.

Modellbewertung, indem er Vorhersagen auf der Basis einer gleichmäßigen Zufallsverteilung trifft. Dies bedeutet, dass er Klassenlabels ohne Berücksichtigung der Eingabedaten oder irgendeiner inhärenten Logik zufällig zuweist, wobei jede Klasse die gleiche Wahrscheinlichkeit der Auswahl hat. Der Hauptzweck eines solchen Modells liegt darin, eine Basislinie zu setzen, gegen die man die Leistung eines tatsächlich trainierten Modells messen kann.

Im Vergleich dazu nutzt der optimierte Random-Forest-Classifier tatsächliche Datenmuster und lernt aus den Beziehungen zwischen den Features und den Zielvariablen, um fundiertere und genaue Vorhersagen zu treffen. Die Ergebnisse zeigen deutlich, dass der Random-Forest-Classifier mit einer Genauigkeit von 79% signifikant besser abschneidet als der Dummy Classifier, der nur eine Genauigkeit von 38% erreicht. Auch in den anderen Metriken wie Präzision, Recall und F1-Score übertrifft der Random-Forest-Classifier den Dummy Classifier um ein Vielfaches. Während der Dummy Classifier Klassenlabels zufällig zuweist und dabei eine geringe Effektivität zeigt, demonstriert der Random-Forest-Classifier seine Fähigkeit, relevante Muster zu erkennen und präzise Vorhersagen zu treffen, was ihn zu einem weit überlegenen Werkzeug für die Klassifizierung macht.
